ELECTRONIC VALVE CONTROLLER
INSTALLATION INSTRUCTIONS
PART # 45003-XK001
PART # 45003-AK004
v.061405

NOTICE
Read this entire manual to understand how the EVC functions before beginning the installation process. Do not attempt to install or adjust the EVC without thorough knowledge of how this unit works. This manual assumes that you have the knowledge in the operation of tools and equipment that are necessary to safely perform service operations on your vehicle. This manual also assumes that you are familiar with typical automotive systems and basic service and repair procedures. Always have access to a factory repair manual as some of the procedures and specifications required for the proper installation of this product may be referenced to the factory repair manual. To avoid the risk of personal injury, follow the lifting, supporting, and safety precautions contained in the factory repair manual.

USER NOTES
- The EVC can be used on both internal and external wastegate type turbochargers.
- The EVC is not capable of reaching boost levels lower than stock (OEM) levels.
- The EVC will maintain its programming even if the vehicle’s battery is disconnected or the head unit is unplugged.
- The serial numbers must match on the control unit and the stepping motor in order for the unit to function properly.
- The EVC is a sensitive electronic component and must be handled with extreme care. Miswiring or shock will damage the unit. Do not place near extreme heat, water, or areas prone to dirt and dust.
- Most factory turbocharged vehicles come equipped with a secondary boost limiting system (fuel-cut system or pop-off valve) to protect against wastegate failure. Due to this, the EVC alone will not be able to raise the boost pressure beyond the point of the factory limit. If this condition occurs, consult your HKS distributor for information regarding products that can assist in this situation (HKS Fuel Cut Defencer, HKS Vein Pressure Converter, HKS Programmed Fuel Computer, etc.).
- If the vehicle has a fuel cut defense system such as the HKS FCD, make certain that the vehicle’s boost pressure is not raised excessively, as this will lead to engine and/or turbocharger damage. HKS will not warranty any damage caused by excessive boost levels.
- Make sure the vehicle has a proper fuel management system that can handle higher boost pressures than stock (OEM) levels. HKS will not warranty damage caused by improper fuel management (lean air/fuel ratio).
- The EVC cannot control boost pressure above the maximum efficiency point of the turbocharger. Boost pressure drop at high rpm may not be totally eliminated. The EVC will not be able to compensate for pressure loss due to turbocharger sizing. Boost creep or boost spikes due to inadequate wastegate flow capacity, lean air/fuel ratio, poor compressor design, or excessive backpressure may not be fully alleviated.
- Increasing the boost pressure will also increase the intake air temperature. If the intake air pressure exceeds 220 degrees Fahrenheit (100 deg. Celsius), performance increases may be minimal and detonation may occur.
- For best performance and to safeguard against detonation, always use the highest octane gasoline available (91-octane minimum).
- Do not rely on the factory boost meter (if equipped) when adjusting the maximum boost pressure. Install an HKS auxiliary boost pressure meter to monitor manifold boost pressure levels.
- The utilization of an HKS A/F Knock Amp (air/fuel ratio meter) or an HKS exhaust gas temperature (EGT) meter is recommended to monitor engine (rich or lean) conditions.
- Mount the EVC control unit, display unit and harness away from high-power amplifiers, two-way radios, mobile phones, and their respective antenna cables to prevent malfunction of the EVC unit.

CONNECTION DIAGRAM
1. Disconnect the negative battery cable from the battery.
2. EVC stepping motor installation:
   - Determine an ideal mounting location for the stepping motor.
   - Mount the stepping motor to the chassis using the hardware provided with this kit.
   - Do not install the stepping motor close to the exhaust manifold or any area of high temperature.
   - Do not install the stepping motor where it will be exposed to water or moisture.
   - Ports 1 (B), 2 (I), and 3 (O) must face upward.
   - Lengths on all hoses must be kept as short as possible.
3. Vacuum Filter Installation:
   - Install vacuum filters per diagram to the right. Make sure the filters are within 10cm (3.9") length from the stepping motor.
   - The 6mm vacuum filter should be installed with the short side facing the stepping motor.
   - Inspect the filters every 3000 miles. They must be clean for the EVC to function correctly. If the filter is contaminated or dirty, replace with a new (4mm) 4599-RA017 or (6mm) 4599-RA016. Do not attempt to clean the vacuum filter. If the filters frequently need replacement, relocating the pressure source may solve the problem.
4. Connect the red wire (2-pin harness) from the EVC to a 12-volt ignition source. Utilizing a voltmeter, find a wire that receives at least 12 volts with the key in the “IGNITION” position.
5. Connect the black wire (2-pin harness) from the EVC to a chassis ground. Make sure there is no paint or rust on the ground surface. If there is, sand the surface until bare metal is exposed.

- **Determine if the vehicle is equipped with an internal wastegate (single port actuator), dual port actuator, or an external wastegate, then proceed to the corresponding installation instructions.**

**INTERNAL WASTEGATE (SINGLE PORT ACTUATOR) INSTALLATION INSTRUCTIONS**

Port #1 (B) - Connect to an uninterrupted intake manifold pressure source after the throttle body such as a compressor bypass signal line using the 4mm hose.
   - Do not connect port #1 to the line that operates the fuel pressure regulator unless the supplemental instructions tell you to do so.
   - This hose should be as short as possible and should not exceed 100cm (3’4”).
   - Install the 4mm vacuum filter within 10cm (3’9") of port #1 on the EVC stepping motor.

Port #2 (I) - Connect to a source of pressurized air such as a turbocharger compressor housing (discharge side) or compressor outlet pipe (before the intercooler) using the 6mm hose.
   - This hose should be as short as possible and should not exceed 100cm (3’4”).
   - Install the 6mm vacuum filter within 10cm (3’9") of port #2 (In) on the EVC stepping motor.

Port #3 (O) - Connect to the port on the wastegate actuator.
   - This hose should be as short as possible and should not exceed 100cm (3’4”).
EXTERNAL WASTEGATE/DUAL PORT ACTUATOR INSTALLATION INSTRUCTIONS

Port #1 (B) - Connect to an uninterrupted intake manifold pressure source after the throttle body such as a compressor bypass signal line using the 4mm hose.
- Do not connect port #1 to the line that operates the fuel pressure regulator unless the supplemental instructions tell you to do so.
- This hose should be as short as possible and should not exceed 100cm (3’4”).
- Install the 4mm vacuum filter within 10cm (3.9”) of port #1 on the EVC stepping motor.

Port #2 (I) - Connect to a source of pressurized air such as the turbocharger compressor housing (discharge side) or compressor outlet pipe (before the intercooler) using the 6mm hose. Use the tee fitting supplied with this kit to connect a pressure line to the secondary port on the wastegate actuator.
- Both lines should be as short as possible and should not exceed 100cm (3’4”).
- Install the 6mm vacuum filter within 10cm (3.9”) of port #2 (In) on the EVC stepping motor.

Port #3 (O) - Connect to the port above the diaphragm on the wastegate actuator or wastegate.
- This hose should be as short as possible and should not exceed 100cm (3’4”).

External Wastegate

Dual Port Actuator

Turbocharger | Airflow Meter
-------------|-------------
Wastegate    | Throttle Plate
              | Intercooler

Turbocharger | Airflow Meter
-------------|-------------
Throttle Plate
              | Intercooler
TROUBLESHOOTING

Notes
- If at any time the EVC does not adjust, the lock code number is forgotten, or the display reads an error code of “100” (no stepping motor memory) the display unit will have to be reset (see EVC Set-Up instructions, 7.2).
- If error code “001” (communication error) is displayed, at least one of the wires on the 3-pin harness has lost continuity.
- As a safety feature, if volume knob A or B was moved when the EVC power was off, the button(s) will flash until the knob is returned to its original position.
- When changing the SW<>PO selection switch, the vehicles 12-volt ignition must be “on” with the EVC power button “off”, otherwise the EVC will not switch over and the power button will flash red. When the EVC power button is turned back on, the display in the upper left corner will illuminate the selected setting --S-- (SW) or --P-- (PO) for about 4 seconds.
- If the ignition is shut-off before 10 seconds after the last setting was made, the last setting may not hold memory.

EVC Control Unit Will Not Illuminate:
- Power Connection- There must be a constant 12-volt power source under all conditions with the ignition “ON”.
- Ground Connection- In some cases, paint, rust, or a loose bolt will cause a bad ground.
- Electronic Splice Connector- Visually from the outside, wire connections may look good. In some cases, the wires are not making contact inside the connector. Check the wires at both ends using a voltmeter to ensure continuity.

EVC Will Not Control Boost:
- Make sure the SW<>PO switch on the back of the unit is in the correct position.
- Check the hose connections at ports 2 (In) & 3 (Out) on the EVC stepping motor. EVC III, IV, and EZ stepping motors differ from EVC I, II and the new EVC stepping motors (see installation diagrams).
- Check for continuity at each wire on the 3-pin harness for a possible break in a wire. Error code “001” will be displayed.

Vehicle Is Not Building Enough Boost (Underboosting):
- Slowly turn up the underboosting A or B volume knob.
- Make sure the stock boost solenoid is disconnected.
- Make sure the boost warning level is not set too low.
- Check for possible improper set-up of the EVC display or control units. Read the manual again to verify that you are following the correct procedures.
- The vacuum filters (4 & 6mm) may be clogged or dirty.

Vehicle Is Building Too Much Boost (Overboosting):
- Turn down the overboosting A or B volume knob.
- Verify that there are no leaks in the hoses, and that all connections are tight. Check for hose damage such as pinholes or tears.
- Wastegate valve may be too small or actuator may be too weak.
- Turbocharger capacity may be too small (In this case, the boost curve will drop off during high rpm compared to the factory boost curve).
- Check for possible improper set-up of the EVC display or control units. Read the manual again to verify that you are following the correct procedures.
- Make sure the vacuum filters (4 & 6mm) are not damaged or cracked.
